Work Experience

School project - Fighting game

Year: 2025 - 2026

Location: *Mexico-San Luis Potosi.*

Job position: *Developer.*

Work: *Code enemy IA.*

In Unity i worked on programming several Artificial Intelligences for a fighting game enemy; each AI had different patterns, such as one that was more aggressive with its attacks, another that kept its distance from the player and attacked from a distance, or another that dodged and grabbed the player more often.

School project - Tower Defense Game

Year: 2025

Location: *Mexico-San Luis Potosi.*

Job position: *Developer.*

Work: *In-game Store.*

In Unreal Engine i worked on a game where you could upgrade your towers. My part was that the player would receive money for defeating enemies, the shop would open and close at the end of each round, items could be purchased and saved to your inventory. The system would also detect which upgrades you had already bought and lock them so you wouldn't have to buy them again.

School project - Mobile Game AR

Year: 2024

Location: *Mexico-San Luis Potosi.*

Job position: *Developer.*

Work: *AR functionality on a mobile game.*

In Unity I created a simple game for mobile devices that used augmented reality. I created a simple system that shot at the center of the screen, spawned an object if the camera detected an image, and if the shot collided with the object, gave you points with a timer that, when finished, displayed a high score.

Academic Training

University of Advanced Technologies

2022 - 2026
